

Nexus Meets Key Engineering Solutions

0:04

So, my name is David Keeling and I'm the founder and managing director of Key Engineering Solutions. For my sins, I'm a former academic with a background in control and robotics. So Key Engineering Solutions provides custom digital solutions to scientists and innovators, helping them make decisions. So generally, one of our systems comprises of hardware linked to software, which either measures and or controls a system.

0:37

So, once we've got that data, we try to make it more visible, create custom analytics for them. It allows them to answer questions such as the how's, the whys, the what's, the where's, so they can make evidence-based decisions.

So, we're looking to develop our business by continuing to grow and sort of scale up our solution size, but also looking to expand more into open innovation, particularly within MedTech and HealthTech, and to create new products, new services that we can then sell.

So, we'd really like to collaborate with other scientists and innovators who are working within robotics or who might need some kind of measurement and control assistance. Also, anyone who just likes a cup of coffee really, just chat about ideas, try and come up with some nice, clustered collaborations and put together some bids.
